

## Machine Learning for Graphs and Sequential Data Exercise Sheet 6

### Graphs: Clustering

**Problem 1:** Given the graph below, find the following partitionings of the graph for  $k = 2$ :

- The partitioning giving the global minimum cut
- A partitioning approximately minimizing the ratio cut
- A partitioning approximately minimizing the normalized cut

**Problem 2:** Consider minimizing the ratio cut on a graph with two clusters  $C_1$  and  $C_2$  and  $N$  nodes in total. The indicator vector

$$f_{C_1,i} = \begin{cases} +\sqrt{\frac{|C_1|}{|C_1|}} & \text{if } v_i \in C_1 \\ -\sqrt{\frac{|C_1|}{|C_1|}} & \text{otherwise} \end{cases}$$

is defined as in the lecture. Prove the following three properties about  $f_{C_1}$ .

- $1^T f_{C_1} = \sum_i f_{C_1,i} = 0$
- $f_{C_1}^T f_{C_1} = \|f_{C_1}\|_2^2 = |V|$
- $f_{C_1}^T L f_{C_1} = |V| \left[ \frac{\text{cut}(C_1, C_2)}{|C_1|} + \frac{\text{cut}(C_1, C_2)}{|C_1|} \right]$

**Problem 3:** Answer the following questions regarding the graph below. Formulate a conjecture first and then verify it computationally in a notebook.

- a) How does the first eigenvector change when increasing the weight between node  $v_6$  and  $v_9$ ?
- b) How does the spectral embedding change?
- c) How does this change affect the final clustering?
