Linear Prediction

- A linear model is expressed in the form

$$\hat{y}_i = \sum_{j=1}^d x_{ij} \theta_j$$

The diagram illustrates the components of the linear model equation $\hat{y}_i = \sum_{j=1}^d x_{ij} \theta_j$. The summation index d is annotated with a purple arrow pointing to it, labeled "input dimension". The term x_{ij} is circled in orange, with an orange arrow pointing to it from below, labeled "Input data, features". The term θ_j is circled in blue, with a blue arrow pointing to it from below, labeled "weights (i.e., model parameters)".

Linear Prediction

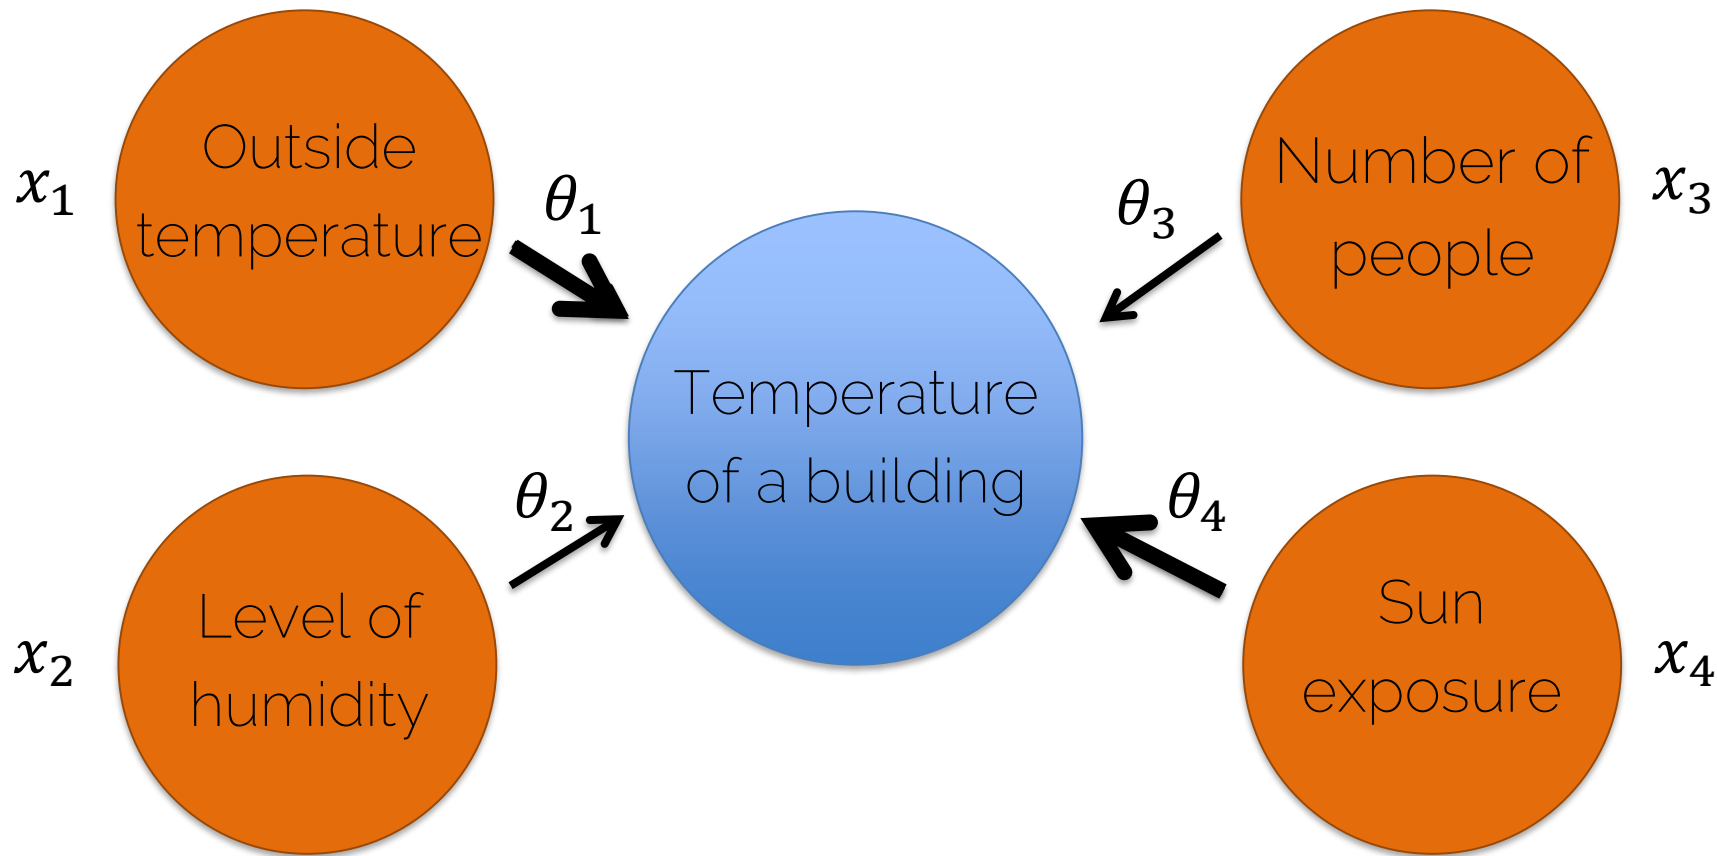

- A linear model is expressed in the form

$$\hat{y}_i = \boxed{\theta_0} + \sum_{j=1}^d x_{ij}\theta_j = \theta_0 + x_{i1}\theta_1 + x_{i2}\theta_2 + \cdots + x_{id}\theta_d$$

Maximum Likelihood

Maximum Likelihood Estimate

$p_{data}(\mathbf{y}|\mathbf{X})$

True underlying distribution

$p_{model}(\mathbf{y}|\mathbf{X}, \boldsymbol{\theta})$

Parametric family of distributions

Controlled by parameter(s)

Maximum Likelihood Estimate

- A method of estimating the parameters of a statistical model given observations,

Maximum Likelihood Estimate

- A method of estimating the parameters of a statistical model given observations, by finding the parameter values that **maximize the likelihood** of making the observations given the parameters.

$$\theta_{ML} = \arg \max_{\theta} p_{model}(\mathbf{y}|\mathbf{X}, \theta)$$

Maximum Likelihood Estimate

- MLE assumes that the training samples are independent and generated by the same probability distribution

$$p_{model}(\mathbf{y}|\mathbf{X}, \boldsymbol{\theta}) = \prod_{i=1}^n p_{model}(y_i|\mathbf{x}_i, \boldsymbol{\theta})$$

“i.i.d.” assumption

Maximum Likelihood Estimate

$$\theta_{ML} = \arg \max_{\theta} \prod_{i=1}^n p_{model}(y_i | \mathbf{x}_i, \theta)$$

Linear Regression

- Maximum Likelihood Estimate (MLE) corresponds to the Least Squares Estimate (given the assumptions)
- Introduced the concepts of loss function and optimization to obtain the best model for regression

Image Classification

Regression vs Classification

- Regression: predict a continuous output value (e.g., temperature of a room)
- Classification: predict a discrete value
 - Binary classification: output is either 0 or 1
 - Multi-class classification: set of N classes

our sigmoid

Logistic Regression

- Probability of a binary output

$$\hat{\mathbf{y}} = p(\mathbf{y} = 1 | \mathbf{X}, \boldsymbol{\theta}) = \prod_{i=1}^n p(y_i = 1 | \mathbf{x}_i, \boldsymbol{\theta})$$

$$\hat{\mathbf{y}} = \prod_{i=1}^n \hat{y}_i^{y_i} (1 - \hat{y}_i)^{(1-y_i)}$$

Model for
coins

Prediction of the
Sigmoid: continuous

True labels: 0 or 1

Logistic Regression: Loss Function

- Probability of a binary output

$$p(y|\mathbf{X}, \boldsymbol{\theta}) = \hat{\mathbf{y}} = \prod_{i=1}^n \hat{y}_i^{y_i} (1 - \hat{y}_i)^{(1-y_i)}$$

- Maximum Likelihood Estimate

$$\boldsymbol{\theta}_{ML} = \arg \max_{\boldsymbol{\theta}} \log p(y|\mathbf{X}, \boldsymbol{\theta})$$

Logistic Regression: Loss Function

$$p(y|\mathbf{X}, \boldsymbol{\theta}) = \hat{\mathbf{y}} = \prod_{i=1}^n \hat{y}_i^{y_i} (1 - \hat{y}_i)^{(1-y_i)}$$

$$\sum_{i=1}^n \log (\hat{y}_i^{y_i} (1 - \hat{y}_i)^{(1-y_i)})$$

$$\sum_{i=1}^n y_i \log \hat{y}_i + (1 - y_i) \log(1 - \hat{y}_i)$$

Logistic Regression: Loss Function

$$\mathcal{L}(\hat{y}_i, y_i) = y_i \log \hat{y}_i + (1 - y_i) \log(1 - \hat{y}_i)$$

$$y_i = 1 \longrightarrow \mathcal{L}(\hat{y}_i, 1) = \log \hat{y}_i$$

Maximize!

$$\boldsymbol{\theta}_{ML} = \arg \max_{\boldsymbol{\theta}} \log p(\mathbf{y}|\mathbf{X}, \boldsymbol{\theta})$$

Logistic Regression: Loss Function

$$\mathcal{L}(\hat{y}_i, y_i) = y_i \log \hat{y}_i + (1 - y_i) \log(1 - \hat{y}_i)$$

$$y_i = 1 \longrightarrow \mathcal{L}(\hat{y}_i, 1) = \log \hat{y}_i$$

We want **$\log \hat{y}_i$** large; since logarithm is a monotonically increasing function, we also want large \hat{y}_i .

(1 is the largest value our model's estimate can take!)

Logistic Regression: Loss Function

$$\mathcal{L}(\hat{y}_i, y_i) = y_i \log \hat{y}_i + (1 - y_i) \log(1 - \hat{y}_i)$$

$$y_i = 1 \longrightarrow \mathcal{L}(\hat{y}_i, 1) = \log \hat{y}_i$$

$$y_i = 0 \longrightarrow \mathcal{L}(\hat{y}_i, 0) = \log(1 - \hat{y}_i)$$

We want $\log(1 - \hat{y}_i)$ large; so we want \hat{y}_i to be small

(0 is the smallest value our model's estimate can take!)

Logistic Regression: Loss Function

$$\mathcal{L}(\hat{y}_i, y_i) = y_i \log \hat{y}_i + (1 - y_i) \log(1 - \hat{y}_i)$$

Referred to as *binary cross-entropy* loss (BCE)

- Related to the multi-class loss you will see in this course (also called *softmax loss*)

Logistic Regression: Optimization

- Loss function

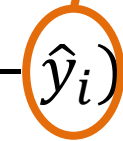

$$\mathcal{L}(\hat{y}_i, y_i) = y_i \log \hat{y}_i + (1 - y_i) \log(1 - \hat{y}_i)$$

- Cost function

$$\mathcal{C}(\theta) = -\frac{1}{n} \sum_{i=1}^n \mathcal{L}(\hat{y}_i, y_i)$$

Minimization

$$= -\frac{1}{n} \sum_{i=1}^n y_i \log \hat{y}_i + (1 - y_i) \log(1 - \hat{y}_i)$$

$$\hat{y}_i = \sigma(\mathbf{x}_i \boldsymbol{\theta})$$

Logistic Regression: Optimization

- No closed-form solution
- Make use of an iterative method → gradient descent

Gradient descent –
later on!

Why Machine Learning so Cool

- We can learn from experience
 - > Intelligence, certain ability to infer the future!
- Even linear models are often pretty good for complex phenomena: e.g., weather:
 - Linear combination of day-time, day-year etc. is often pretty good

Many Examples of Logistic Regression

- Coronavirus models behave like logistic regressions
 - Exponential spread at beginning
 - Plateaus when certain portion of pop. is infected/immune

Many Examples of Logistic Regression

- Coronavirus models behave like logistic regressions
 - Exponential spread at beginning
 - Plateaus when certain portion of pop. is infected/immune

Think about good features:

- Total population
- Population density
- Implementation of Measures
- Reasonable government 😊 ?
- Etc. (many more of course)

The Model Matters

- Each case requires different models; linear vs logistic
- Many models:
 - #coronavirus_infections cannot be $>$ #total_population
 - Munich housing prizes seem exponential though
 - No hard upper bound \rightarrow prizes can always grow!
